

Juvéderm Experience Trial

SKINQRI was one of the sites in a multi-center trial to evaluate the persistence and satisfaction of JUVÈDERM® ULTRA in patients seeking correction of moderate to severe nasolabial folds that have been previously treated with Restylane®.

Abstract:

Six female subjects were enrolled at our site and received treatment to the nasolabial folds with two syringes of JUVÈDERM® ULTRA. They were evaluated at 3 months, 6 months and 9 months after the treatment.

At the 9 month follow up visit all subjects reported being very satisfied with the appearance and how long the reduction in their nasolabial folds had lasted. 33% rated their improvement as noticeable, 33% rated it as very noticeable, and 33% rated it as complete. No one reported no change or only somewhat noticeable results. On average subjects at our site felt the results lasted 8.7 months.

Above is at baseline and below is 9 months post treatment.

Above is at baseline and below is 6 months post treatment.
